GitHub Copilot Architecture Exam Preparation

A Markdown-first study repository for preparing for the GitHub Copilot architecture exam. Use it to organize study notes, review key concepts, and track preparation progress.

Study areas

- GitHub Copilot architecture and components
- Models, prompts, and context
- Copilot features and supported development workflows
- Administration, configuration, and policy controls
- Security, privacy, and responsible AI
- Integrations, extensibility, and troubleshooting

Preparation plan

1. Review the current exam objectives and official GitHub documentation.
2. Add concise notes and links for each study area.
3. Record questions or concepts that need more review.
4. Revisit the notes and verify details against current official sources.

Repository format

Study materials should be Markdown files with the ‘.md‘ extension. Keep source links alongside notes so information can be checked for accuracy and currency.

Pull requests are checked automatically. The check fails if the proposed repository contains a tracked file that does not end in ‘.md‘, except for ‘.github/workflows/markdown-only.yml‘, which is the GitHub Actions workflow that runs the check. The default branch is protected so changes must go through a pull request and pass the check before they can be merged.

Disclaimer

This is an independent study repository and is not affiliated with or endorsed by GitHub. Exam objectives and product capabilities can change; refer to official GitHub resources for the latest information.
